

Policy Effects on Mixed-Citizenship, Same-Sex Unions: A Triple-Difference Analysis

Nathan I. Hoffmann, Department of Sociology, University of California, Los Angeles

Kristopher Velasco, Department of Sociology, Princeton University

October 21, 2022

Abstract

After the U.S. Supreme Court struck down the Defense of Marriage Act (DOMA) in 2013, same-sex partners of U.S. citizens became eligible for spousal visas. Since then, the U.S. has seen a rapid rise in same-sex, mixed-citizenship couples. However, this effect varies greatly depending on the LGB policy context of the non-citizen's country of origin. Using waves 2008 to 2019 of the American Community Survey, this study employs a triple-difference design to examine how the policy environment of the origin country moderates the effect of the end of DOMA. Quasi-Poisson models with two-way fixed effects show that, after 2013, individuals in mixed-citizenship same-sex couples coming from countries with progressive LGB policy saw a more than 50-percent increase in incidence relative to those in different-sex or same-citizenship couples. Meanwhile, those from countries with regressive laws experienced no relative increase. Furthermore, effects appear greatest for laws around same-sex civil unions and marriage. We argue that the policy context of country of origin leaves a lasting cultural impact on immigrants that shapes their response to policy shifts in their country of residence, even many years after migration.

1 Introduction

Unions, “a term encompassing marriage and nonmarital cohabitation” ([Bloome and Ang 2020, 1754](#)), are of central concern to many sociologists and demographers. This is because unions provide meaningful life experiences for those who enter them, but also because they are demonstrated to influence a range of important quality-of-life indicators. Moreover, studying how union formations change across populations can reveal other social processes of particular concern to a variety of sociologists: changing migration flows, gendered workforce participation, (de)institutionalization of cultural norms, and shifts in state governance and public policy – to name a few.

While research on unions in the United States historically privileges those in different-sex relationships, this line of research has recently expanded to include those in same-sex unions ([Baumle, Compton, and Poston 2009](#); [Rosenfeld and Kim 2005](#); [Kolk and Andersson 2020](#)). Research into this new domain is, in part, driven by both cultural and legal recognition of these alternative family formations. Now, studies seek to understand how previous demographic and sociological theories are strengthened or must be re-imagined when considering these additional arrangements ([Martell and Nash 2020](#); [Reczek et al. 2017](#); [Manning, Brown, and Stykes 2016](#)). We contribute to this rich scholarly domain by considering an additional union type: those containing same-sex individuals of mixed-citizenship status.

While mixed-citizenship couples generally face particular barriers to union formation ([López 2021](#)), numbers of mixed-citizenship, same-sex unions have been on a dramatic rise in recent years. This is likely due to an important policy change: In 2013, the U.S. Supreme Court ruled the Defense of Marriage Act (DOMA) unconstitutional. For the first time, U.S. citizens could sponsor the visa of their same-sex fiancé or spouse ([Edwards 2013](#)). In the years since, the U.S. population of immigrant-containing same-sex couples has grown rapidly ([Hoffmann and Velasco 2021](#); [Redpath 2022](#)). Data on cohabiting partners and spouses from the American Community Survey (ACS, [Ruggles et al. 2021](#)) show that numbers of different-sex, mixed-citizenship couples grew by 8 percent from 2013 to 2019 (from 4.2 million to 4.5 million), while corresponding same-sex couples

increased by 156 percent (from 38 thousand to 96 thousand) in the same period.

The growth of this new union type invites the need for additional research to again understand how this population confirms or complicates existing theory. While the DOMA decision opened this union pathway to all, uptake is unlikely to be homogeneous and may reinforce existing inequalities. Namely, we bring in theories from cultural sociology to argue that, like all relationship forms, same-sex unions are a cultural object specific to time and place (Kalmijn 2007; Treas, Lui, and Gubernskaya 2014; Wang and Schofer 2018). By defining what is possible, state policies that exist at an immigrant’s country of origin shape the cultural products to which they aspire. For example, legally entering into a same-sex union was neither thinkable nor desirable for many until quite recently; progressive LGB policies institutionalizes this new cultural form and then expand support and participation in a recursive process (Baiocco, Argalia, and Laghi 2014). On the other hand, regressive LGB policies can limit the horizon of union possibilities, instill fear of punishment for disclosing one’s same-sex union, and negatively influence whether U.S. immigration officials view same-sex relationships from these countries as credible (Carron 2015). Hence, we argue that the repeal of DOMA will likely function as a pathway to spousal visas only when an immigrant’s country of origin’s institutional context is affirming of LGB communities.

Figure 1: Estimated counts of individuals in mixed-citizenship, same-sex couples from the American Community Survey. The “Regressive” sample includes only countries with a LGB policy score less than 0, and the “Progressive” sample includes only those with a score greater than 3.

To test our theory, we apply cutting-edge methods of causal inference. Using waves 2008 to 2019 of the ACS, we employ a triple-difference, quasi-Poisson model with two-way fixed effects to estimate the effect of the post-2013 legal context in the U.S. on numbers of mixed-citizenship same-sex couples reported in the ACS. By controlling for incidence of mixed-citizenship and same-citizenship couples that we would not expect to be impacted by this policy, this design allows us to isolate the effect of DOMA's repeal specifically on unions of interest ([Redpath 2022](#)). To assess the role of LGB policy at the country of origin, we rely on an original dataset indexing LGB policy changes in 123 countries from 1991 to 2019. We stratify the sample by the LGB policy context at the country of origin to examine how the policy environment of the origin country moderates the effect of the end of DOMA.

Our findings reveal that, after 2013, individuals in mixed-citizenship same-sex couples hailing from countries with progressive LGB policies saw a more than 50-percent increase in incidence relative to those in different-sex or same-citizenship couples. Meanwhile, those from countries with regressive laws experienced no significant increase. Stratifying by specific policy shows that effects are greatest for laws legalizing same-sex civil unions and marriage. This suggests that the country-of-origin policy context leaves a lasting cultural impact on immigrants that shapes their response to policy shifts in their country of residence, even many years after migration.

Our work adds to and connects the burgeoning literature on the importance of culture in shaping both migration ([Benson and O'Reilly 2009](#); [Dixon 2020](#); [Thompson 2017](#)) and union decisions ([Wang and Schofer 2018](#); [Msibi 2013](#)). These results support the notion that institutional forms may be relevant outside of their obvious domain of influence.

2 Background

2.1 The Overturning of Defense of Marriage Act and Expansion of Mixed-Citizenship, Same-Sex Unions

The United States Supreme Court overturned the Defense of Marriage Act (DOMA) in *United States v. Windsor* in 2013. Enacted in 1996, DOMA banned the federal government from recognizing same-sex marriages as it instilled a heterosexual definition of marriage and spouse. Even if same-sex marriages were legalized at the state level, then, such recognition did not unlock access to federal marriage benefits. Thus, the Windsor decision carried significant implications for same-sex couples as they could now jointly file federal tax returns, secure Social Security benefits, and participate in numerous other federal programs like the Supplemental Nutrition Assistance Program.

Another important consequence of the DOMA ruling was unlocking spousal visas for same-sex couples ([Edwards 2013](#)). The federal government has long provided a pathway for U.S. citizens to secure permanent residency, and eventual citizenship, for their migrant spouses and fiancés. Indeed, family reunification is privileged within U.S. migration law and such cases represent the vast majority of new migrants into the U.S. However, DOMA prevented access to these visas because the federal government did not recognize same-sex unions as legitimate or valid – thus categorically denying access. Additionally, DOMA had a downstream effect where even if a U.S. state were to legalize marriage, mixed-citizenship couples (where one partner is a U.S. citizen and where the other is a non-citizen) were unlikely to take advantage of these state-level benefits. This is because a condition of non-permanent residents' visas is to not show intent on staying in the U.S. permanently – something marriage to a U.S. citizen can potentially violate. The Windsor decision allowed mixed-citizenship couples access to spousal visas and, where legal, for such couples to get married and switch visa types. As a direct consequence of undoing DOMA, [Redpath \(2022\)](#) finds a 36 percent relative increase in partnering of mixed-citizenship same-sex couples and a 78 percent increase in these types of marriages.

These increases in mixed-citizen couplings as found by Redpath are significant. The dramatic rise in mixed-citizen couplings can be the result of two distinct mechanisms: an increased entry into such unions of individuals already residing in the U.S. and the direct immigration of one or both members of the couple into the U.S. due to the policy shift. Regardless of pathway, these rising trends open new questions, such as: What are the characteristics of immigrants selecting into these relationships? How does one's country-of-origin condition entering into such a union?

Indeed, as shown in Figure 1, the rapid increase after 2013 was not uniform across immigrants from all countries. For those hailing from countries with progressive LGB policies, the increase was indeed rapid after 2013. However, from those with regressive LGB policies, no increase occurred. Why do we see so much variation by policy context at the country of origin?

2.2 Intersections of Culture, Law, and Sexuality in Understanding Union Formation

Prior to presenting explicit hypotheses into this division in country-of-origin differences in mixed-citizenship, same-sex unions, we first present a general theoretical framework for understanding the significance of our research question. To do so, we bring together scholarship on union formation, culture, public policy, and queer migration.

To begin, family formation, especially understanding processes related to unions, remains a central concern of many sociologists and demographers. Attention to unions derives both from their subjective importance to many individuals' everyday lives but also because they are an important mechanism that influence a range of outcomes (e.g., health and well-being, economic mobility, social integration) and because their formation and structure reveal on-going social transformations in society (e.g., gendered labor force participation, (de)institutionalization of cultural norms, changing migration patterns). We aim to contribute to this rich area of scholarship by weaving together research on mixed-citizenship unions and same-sex unions to illuminate a less-studied union type: mixed-citizenship, same-sex couples.

First, a significant body of research focuses on unions between mixed-citizenship individuals,

typically a native-born U.S. citizen and a foreign-born immigrant without full citizenship. Research in this area demonstrates that rates of intermarriages between foreign-born and native-born populations reflects the degree to which foreign-born individuals are socially integrated into broader U.S. society or remain bounded within ethnic or class enclaves (Lichter, Qian, and Tumin 2015). Moreover, additional research highlights how these union types are accompanied by increased stress due to differences in each individual's recognition by the state (López 2015, 2021). Second, a burgeoning area of research focuses on same-sex unions [xx]. Especially following recent legalizations in marriage equality, this work seeks to understand how same-sex couples compare to different-sex couples across a range of outcomes (e.g., satisfaction, relationship stability, division of labor) and how shifting legal environments alter LGBT individuals' desire to join such a union or alters their behaviors in the union once legal recognition is conferred [xx].

Though studies investigate different dimensions of each union type, these lines of research have largely proceeded on independent paths (Carrillo 2018). This separation is due to research on mixed-citizenship couples assuming heterosexuality and research on same-sex unions assuming U.S. citizenship (Luibhéid 2008). Thus, scholarship sitting at the intersection of this Venn diagram is limited. While queer migration research is expanding, this area of research largely focuses on refugees seeking asylum in the U.S. or qualitative studies into the motivations and experiences of queer migrants. As such, little is known regarding mixed-citizenship, same-sex unions. Attending to this union type is important due to its rapid growth in the U.S., as demonstrated in Figure 1, and because we do not know the degree to which these unions confirm or challenge existing theories (xx work on this).

2.3 Country of Origin and Selection into Same-Sex Unions

Although the DOMA decision equally applied to all mixed-citizenship couples, Figure 1 highlights an important line of differentiation: There is a distinct rise in couples where the non-U.S. citizen came from a country with more progressive LGB policies. Numbers of couples where the non-U.S. citizen came from a country with regressive LGB policies, such as bans on sodomy, remain

unchanged. Why might this be? Why would conditions at the immigrant partner's country of origin influence the distribution of same-sex union formation across the population of mixed-citizen couples in the U.S.? We argue that by investigating the interplay between law and culture, we can understand the diverging trends found in Figure 1.

Relationships, and marriage specifically, are unique cultural products ([Rosenfeld 2007](#)). The rituals, symbols, norms, and roles that govern them have different instantiations depending on the time and place. These cultural products then influence and are influenced by the legal expectations and conditions associated with relationships ([Kalmijn 2007](#); [Treas, Lui, and Gubernskaya 2014](#); [Wang and Schofer 2018](#)). This is especially true for same-sex unions in the present historical moment ([Hull 2003](#); [Ocobock 2020](#)). The assimilation of same-sex couples into existing marriage and relationship programs is a very current, dynamic process ([Bernstein and Taylor 2013](#); [Saez 2011](#)). Denmark became the first country to recognize civil unions for same-sex partners in 1989 while Netherlands became the first to grant full marriage equality in 2001. At the end of 2021, 31 countries had recognized full marriage equality with an additional 13 recognizing civil unions.

Of the many consequences of these shifts toward more progressive policies, one is that they shift our understanding of what is permissible and seen as possible. Prior to state recognition, there are often public campaigns by LGBT+ organizers seeking to influence broad support. While geared toward the general public, this campaign rhetoric and imagery also socializes LGB individuals into the appropriateness of participating in institutions long exclusive to heterosexuals ([Bernstein and Taylor 2013](#)). This is particularly important as participation in same-sex unions by LGB individuals is a critical strategy to normalize and secure such legal advancements ([Ocobock 2020](#)). State recognition of same-sex couples also takes on a recursive process of increasing desirability of forming such a union as participation becomes a real option ([Baiocco, Argalia, and Laghi 2014](#)). Thus, immigrants coming from a country with an affirming policy environment that recognizes the validity of same-sex unions may be more inclined to establish and desire such a union once permitted to do so following DOMA.

Conversely, policy environments that are especially regressive can hinder the formation of

mixed-citizenship, same-sex unions by immigrants in the U.S. This can operate in multiple ways. First, regressive contexts can potentially limit the desirability of forming a same-sex union by limiting what is seen as possible. At the end of 2021, roughly 70 countries still criminalized same-sex sexual acts between two consenting adults [xx]. While in some countries these laws are rarely enforced, in others, such as Cameroon, there has been an active revival of these laws to terrorize LGB populations (Bongmba 2021). Moreover, the DOMA legislation in the U.S. was not a unique act. More than 30 countries since the 1990s have similarly re-codified a “one man, one woman” definition of marriage either through federal law like DOMA or through constitutional amendments [xx]. Second, these legal environments can influence how the cultural norms, rituals, and performances of relationships manifest. In the U.S. and many Western countries where marriage equality exists, mainstream LGB cultures emphasize publicly “coming out” and sameness with heterosexuals using language such as “love is love.” But LGB cultures where “coming out” risks vulnerability state-sponsored violence can look quite different (Msibi 2013). Third, and relatedly, these different cultures can negatively influence whether U.S. immigration bureaucrats in charge of issuing visas perceive relationships as legitimate (Carron 2015). When photos, disclosure to friends and family, and other public pieces of evidence are used to evaluate if a relationship is valid and worthy of a visa, immigrants coming from countries where such pieces of evidence can be harmful are at a systematic disadvantage. Thus, for all of these reasons, mixed-citizen, same-sex unions following the 2013 DOMA decision are likely to contain fewer immigrant partners from regressive contexts.

2.4 Empirical Expectations

To address our second research question, we will examine which specific LGB policies of countries of origin are associated with the strongest effect on increase in same-sex, mixed-citizenship unions. We hypothesize that policies relating specifically to unions – such as a provision for civil partnerships – are most important. In addition, we will examine the effect of one specific regressive policy – same-sex marriage bans – to test the implications of our theory. If it is correct, then even negative reinforcement of the institution of same-sex unions may have a lasting impact on

immigrants’ cultural repertoires.

3 Data and Methods

3.1 Data

We employ data from the 2008 to 2019 American Community Survey ([Ruggles et al. 2021](#)). Each year, the ACS surveys a 1-percent representative sample of the U.S. population about a variety of individual and household attributes. We focus on counts of individuals in mixed-citizenship same-sex couples, comparing to those in same-citizenship or different-sex couples. Our counts include only cohabiting individuals who identify themselves as spouses or unmarried partners, since the ACS does not allow identification of same-sex couples that do not reside together. “Mixed-citizenship” couples include either two citizens or two non-citizens, and “same-sex” couples include two individuals who report the same sex. We exclude individuals who immigrated before the age of 18 as well as those younger than 18 or older than 64 in each survey year.

Beginning in 2008 the Census Bureau made changes to ACS gender and partnership questions in order to prevent such errors ([U.S. Census Bureau 2013](#)), so we rely on data only from 2008 onward. In addition, following Gates and Steinberger ([2009](#)), we remove all respondents that had either their relationship or sex variable imputed by the Census Bureau. See Table 1 for sample sizes.

Table 1: Unweighted and weighted sample sizes from American Community Survey (ACS) data, 2008-2019

| Composition | Citizenship | n (unweighted) | n (weighted) |
|---------------|-------------------|----------------|---------------|
| Different sex | Mixed citizenship | 467,611 | 50,313,621 |
| Different sex | Same citizenship | 11,103,024 | 1,046,422,984 |

| Composition | Citizenship | n (unweighted) | n (weighted) |
|-------------|-------------------|----------------|--------------|
| Same sex | Mixed citizenship | 7,305 | 694,122 |
| Same sex | Same citizenship | 147,459 | 13,630,989 |

Our analytic strategy proceeds in two parts. First, how does LGB policy at country of origin moderate the effect of the repeal of DOMA on the incidence of same-sex, mixed-citizenship couples in the U.S.? Second, which specific LGB policies of country of origin are most relevant in shaping entry into same-sex unions?

To isolate the effect of the 2013 DOMA repeal, we employ a triple difference, or difference-in-differences-in-differences (DDD), quasi-Poisson design ([Hausman, Hall, and Griliches 1984](#); [Olden and Møen forthcoming](#)). We model counts as draws from a Poisson distribution, but estimate our model more flexibly by using quasi-maximum likelihood estimation (QMLE). Unlike Maximum Likelihood Estimation (MLE), this estimation method does not assume the mean and variance of the distribution are equal, adjusting standard errors accordingly ([Cameron and Trivedi 2005, 667](#)). We include two-way fixed effects, with indicators for survey year and state-group, and cluster standard errors at the state-group level.

Our estimand is the relative change in incidence of individual in mixed-citizenship, same-sex couples following the repeal of DOMA in 2013. We estimate this as the coefficient to a three-way interaction between indicators for same-sex, mixed-citizenship, and post-2013 survey year. We write our model as

$$y_{gst} = \exp[\beta_0 + \beta_1 post_t + \beta_2(M_g \times post_t) + \beta_3(S_g \times post_t) + \beta_4(M_g \times S_g \times post_t) + \alpha_{gs} + \gamma_t + \epsilon_{gst}]$$

where y_{gst} is the count of individuals in group g in state s in survey year t ; $post_t$ is an indicator variable for $t > 2013$; M_g is an indicator variable for group g being mixed-citizenship; S_g is an

indicator variable for group g being same-sex; α_{gs} are group-state fixed effects; γ_t are survey year fixed effects; and ϵ_{gst} is an error term such that $\mathbb{E}(\epsilon_{gst}) = 0$. The coefficient of interest is β_4 ; the incidence ratio $\exp(\beta_4)$ estimates the relative increase in mixed-citizenship same-sex couples after 2013, relative to other couples.

We focus on heterogeneity of this effect: how it varies by the LGB policy context of non-citizens' country of origin. We measure the origin country policy environment using a modified LGBT Policy Index (Velasco 2018) for 1991 to 2019. The index comprises 16 policies, with both progressive policies (civil unions, constitutional protection, conversion therapy ban, employment protection, equal age of consent, hate-crime protection, incitement to hate banned, joint adoption, lgb military, marriage equality, same-sex acts legal) and regressive ones (anti-propaganda laws, death penalty, lgb military ban, marriage ban, unequal age of consent). The index is created by summing the net total of progressive policies (scored +1) over regressive policies (scored -1). For the 224 countries of origin for our sample, the country index ranges from -3 to 10, with a mean of 1.7 in our sample. Group-state-year-country cells are assigned the average score in the year of immigration for non-citizen individuals in that cell.

4 Results

4.1 Main Effects

Table 2 presents results from our DDD specifications. For the full sample, the incidence of individuals in mixed-citizenship, same-sex couples grew by $100 \times [\exp(0.33) - 1] = 38$ percent after 2013, relative to those in couples that were not same-sex or mixed-citizenship. The result is even stronger if the sample is limited to individuals from progressive countries (defined as those with an LGB policy score greater than 3), at 61 percent. However, those from regressive countries (with a policy score less than 0) saw no significant increase at all.

Figure 2 presents dynamic models of the effect of interest. These models replace the post-2013 indicator variable with a categorical variable for survey year, with years grouped into pairs for

Table 2: Quasi-Poisson DDD regressions of counts of mixed-citizenship same-sex couples, stratifying by state-country-year-group average policy environment

| | Full sample | Progressive | Regressive |
|---|----------------------|----------------------|-----------------------|
| Post-2013 × Same-sex × Mixed-citizenship | 0.326 *** (0.050) | 0.475 *** (0.100) | 0.103 (0.097) |
| Post-2013 × Same-sex | 0.370 *** (0.017) | 0.373 *** (0.018) | 0.374 *** (0.019) |
| Post-2013 × Mixed-citizenship | 0.101 *** (0.015) | 0.283 *** (0.042) | 0.019 (0.049) |
| Post-2013 | -0.035 ** (0.011) | -0.038 * (0.015) | -0.065 *** (0.011) |
| Observations | 2448 | 2448 | 2448 |

*** $p < 0.001$; ** $p < 0.01$; * $p < 0.05$; † $p < 0.1$. The "Regressive" sample includes only countries with a LGB policy score less than 0, and the "Progressive" sample includes only those with a score greater than 3. Group-clustered standard errors shown in parentheses. Source: American Community Survey 2008-2019. Authors' calculations.

statistical power. The left panel shows this lag-lead specification for the full sample. We see that coefficients for the three-way interaction between year, same-sex, and mixed-citizenship become significantly positive only after 2013. The right panel presents the same specification, but for the stratified samples as in Table 2. Here, we see a clear upward trend for non-citizens from progressive countries, while the trend for those from regressive countries hovers close to 0. Also of note across all samples is the lower coefficient for the years 2018-2019, perhaps demonstrating a "Trump effect" reducing LGB immigration or the willingness of LGB citizens and non-citizens to enter into unions.

Although the two-way fixed effects in our specifications allay concerns confounders, it is still possible that time-varying state- and group-level variables may be confounding results. We test the robustness of our results by re-specifying our models while adjusting for additional variables. State-year-level per capita income by year comes from the Bureau of Economic Analysis ([BEA](#)

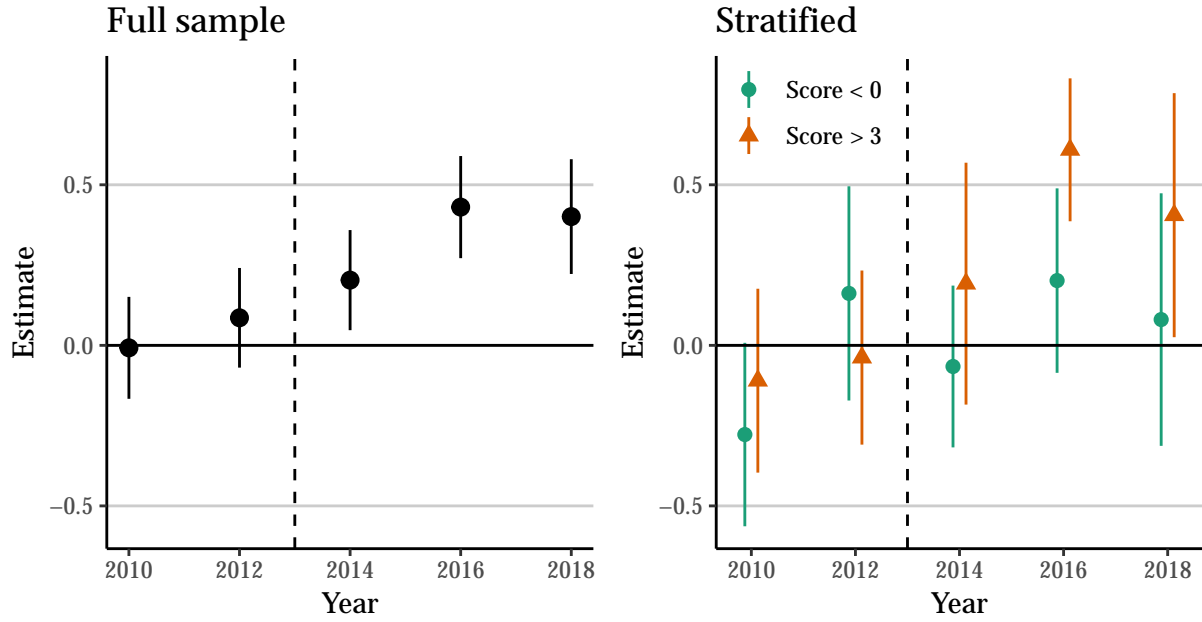

Figure 2: Dynamic specification of quasi-Poisson regression with two-way fixed effects, displaying the coefficient for the Year \times Same-sex \times Mixed-citizenship interaction. Survey years are aggregated into pairs, with 2008-2009 as the base category.

2020), and annual unemployment rates come from the Bureau of Labor Statistics (BLS 2020). We also create a U.S. state-year LGB policy index by compiling data from the Movement Advancement Project¹, a leading LGB organization in the U.S. that collects data on a number of relevant policies. Like the origin-country index, the state index comprises both progressive policies (full marriage equality, state recognition of civil unions and domestic partnerships, ban on all employment and housing discrimination based on sexual orientation, hate crime protections based on sexual orientation, legal joint adoption by same-sex couples, and a ban on conversation therapy for minors) and regressive policies (criminalization of sodomy, state constitutional bans of marriage equality, religious freedom exemptions to discriminate against same-sex couples in adoption, and state-level bans on local non-discrimination ordinances encompassing sexual orientation). The state index ranges from -2 to 7, and the mean state policy score for immigrants in our sample is 2.3.

Table 3 replicates Table 2, but with these additional controls. Coefficients are only slightly attenuated, and substantive conclusions do not change. Notably, the coefficient for state LGB policy is small and nonsignificant; in these models, state LGB policy does not appear related to the

¹<https://www.lgbtmap.org/>

incidence of same-sex unions.

4.2 Which Policies are Responsible?

Clearly, the post-2013 rise in mixed-citizenship same-sex unions occurred much more strongly for immigrants from countries with overall progressive LGB policies. But are there some policies that matter more than others? Whereas Table 2 stratified the sample by values of the policy index, here we stratify the sample by specific policies. Within each cell, we include only mixed-citizenship

couples for whom the non-citizen country of origin has an average value greater than 0 for the policy of interest – i.e., where immigrants in that group tended to experience the given policy in their year of immigration.

Figure 3 displays coefficients from the three-way interaction of interest, showing the logged relative incidence of mixed-citizenship same-sex couples after 2013. Coefficients in models focusing on progressive policies are mostly positive. Notably, coefficients for civil unions and marriage equality are especially high.

The right panel of Figure 3 shows mostly nonsignificant coefficients for regressive policies. Those that are significant have smaller point estimates than most progressive policies. One possible explanation for the range of results for regressive policies is that more “severe” regressive policies, such as the death penalty, are more effective at erasing the possibility of same-sex unions. Meanwhile, policies such as anti-propaganda laws are often a backlash to an already established LGB community and its cultural forms (XX).

Figure 3: Stratified by specific policy: quasi-Poisson DDD regressions of counts of mixed-citizenship same-sex couples, stratifying by state-country-year-groups with policy averages greater than 0. Estimates and 95-percent confidence intervals are for the three-way interaction between indicators for same-sex, mixed-citizenship, and post-2013 survey year.
