A Descriptive Statistics

Table A.1: Summary statistics for country-level analysis

Characteristic	N = 3,454
Percent in same-sex couples	0.00 (0.00, 0.43)
Country LGB policy score	1 (0, 3)
Distance (km)	8,939 (7,457, 11,460)
Contiguous border	58 (1.7%)
Common official language	801 (23%)
Common ethnic language	1,411 (41%)
Ever colonial relationship	116 (3.4%)
Per-cap. GDP difference	27 (19, 32)
Unemployment difference	-0.5 (-4.4, 2.0)
Liberal democracy (V-Dem)	0.40 (0.17, 0.74)
Proportion same-country stock	0.002 (0.001, 0.005)

¹ Median (IQR); n (%)

Table A.2: Summary statistics for state-level analysis

Characteristic	N = 37,980
Percent in same-sex couples	0.00 (0.00, 0.00)
State LGB policy score	2 (0, 5)
Country LGB policy score	1 (0, 3)
Distance (km)	8,915 (7,411, 11,716)
Contiguous border	1,135 (3.0%)
Common official language	8,951 (24%)
Common ethnic language	17,070 (45%)
Ever colonial relationship	1,940 (5.1%)
Per-cap. GDP difference	29 (22, 32)
Unemployment difference	-1.5 (-5.4, 1.2)
Liberal democracy (V-Dem)	0.42 (0.21, 0.76)
Proportion same-country stock	0.003 (0.001, 0.009)
State unemployment rate	5.70 (4.26, 7.77)
State per-capita income	31.9 (28.8, 36.3)

¹ Median (IQR); n (%)

Table A.3: Summary statistics for individual-level analysis

Characteristic	Overall, N = 907,648	Different-sex, N = 900,571	Same-sex, N = 7,077
State LGB policy			
Repressive	191,615 (21%)	190,674 (21%)	941 (13%)

¹ n (%); Median (IQR)

B Additional Descriptive Trends

Figure B.1 relies on the data used in the country-level models. The vertical axis represents the proportion of immigrants from each country in same-sex couples in each year of immigration, from 1991 to 2019, while the horizontal axis indicates the policy score of the country of origin in the year of immigration. The line shows the bivariate regression line. Percentages above 5 are not shown (hiding 24 out of 3,454 country-years).

Figure B.2 relies on the data used in the state-level models, with the vertical axis showing the proportion of immigrants from each country in same-sex couples in each state, in each survey year, from 2008 to 2019. In the left panel, the horizontal axis represents the origin country policy score in the mean year of immigration for that group, while the right panel's horizontal axis represents the state policy score in the survey year. The lines shows the bivariate regression lines.

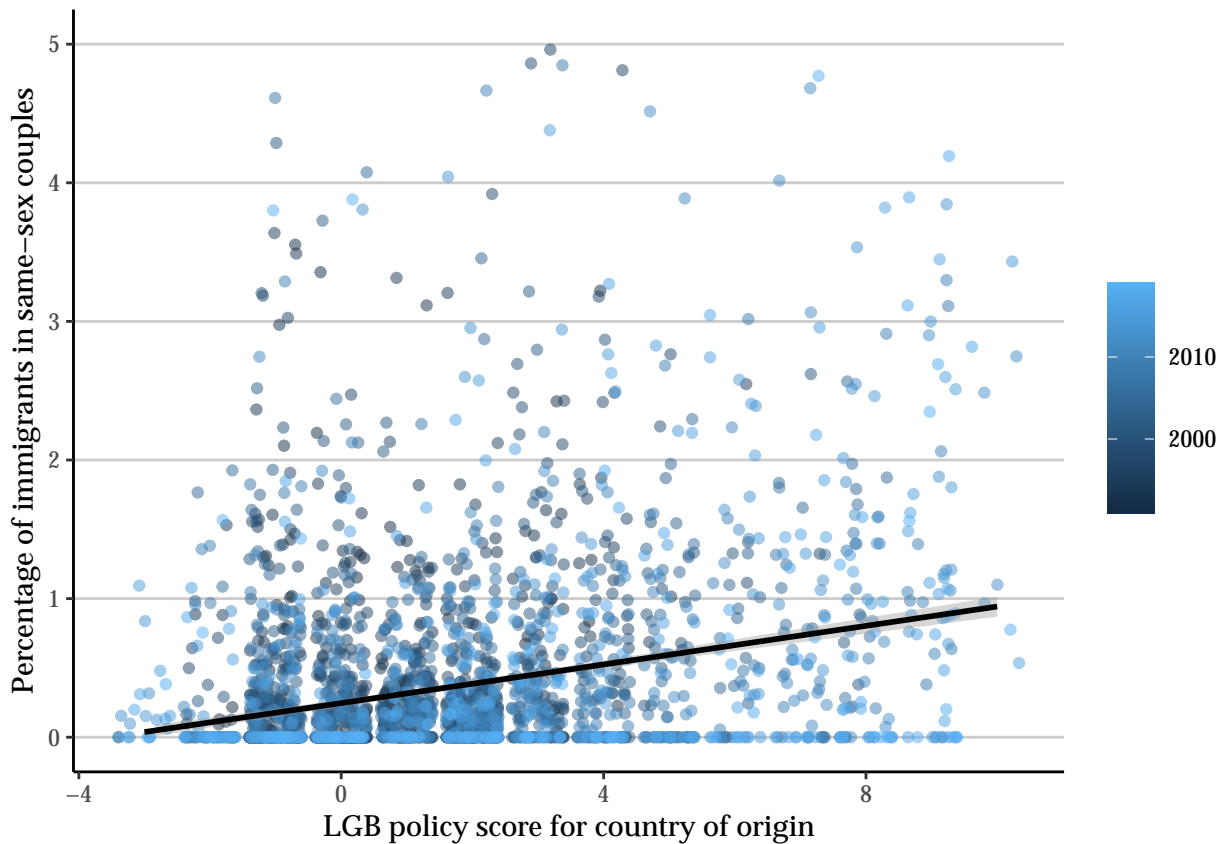

Figure B.1: Proportion of immigrants from each country in same-sex couples in each year of immigration, from 1991 to 2019. The horizontal axis indicates the policy score of the country of origin in the year of immigration. Points are jittered for clarity, and percentages above 5 are not shown.

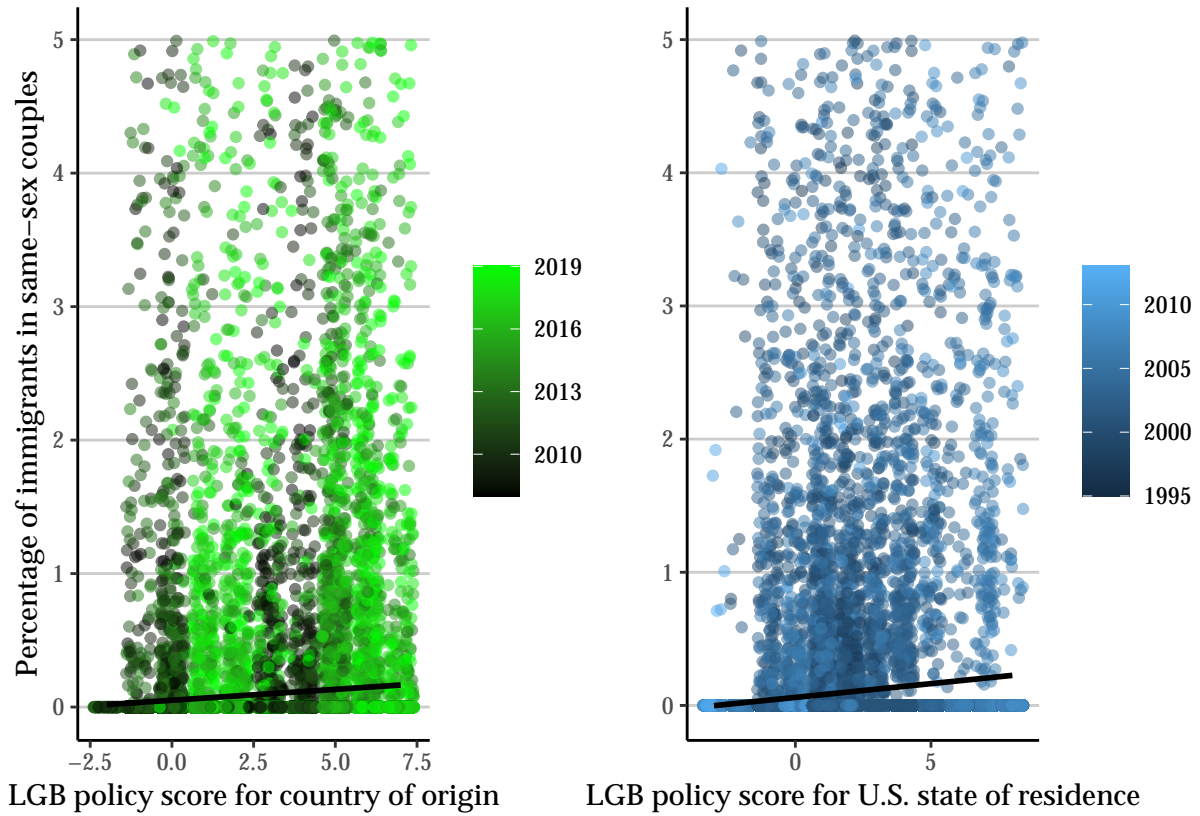

Figure B.2: Proportion of immigrants from each country in same-sex couples in each state, in each survey year, from 2008 to 2019. The left panel's horizontal axis represents the origin country policy score in the mean year of immigration for that group, while the right panel's horizontal axis represents the state policy score in the survey year. Points are jittered for clarity, and percentages above 5 are not shown.

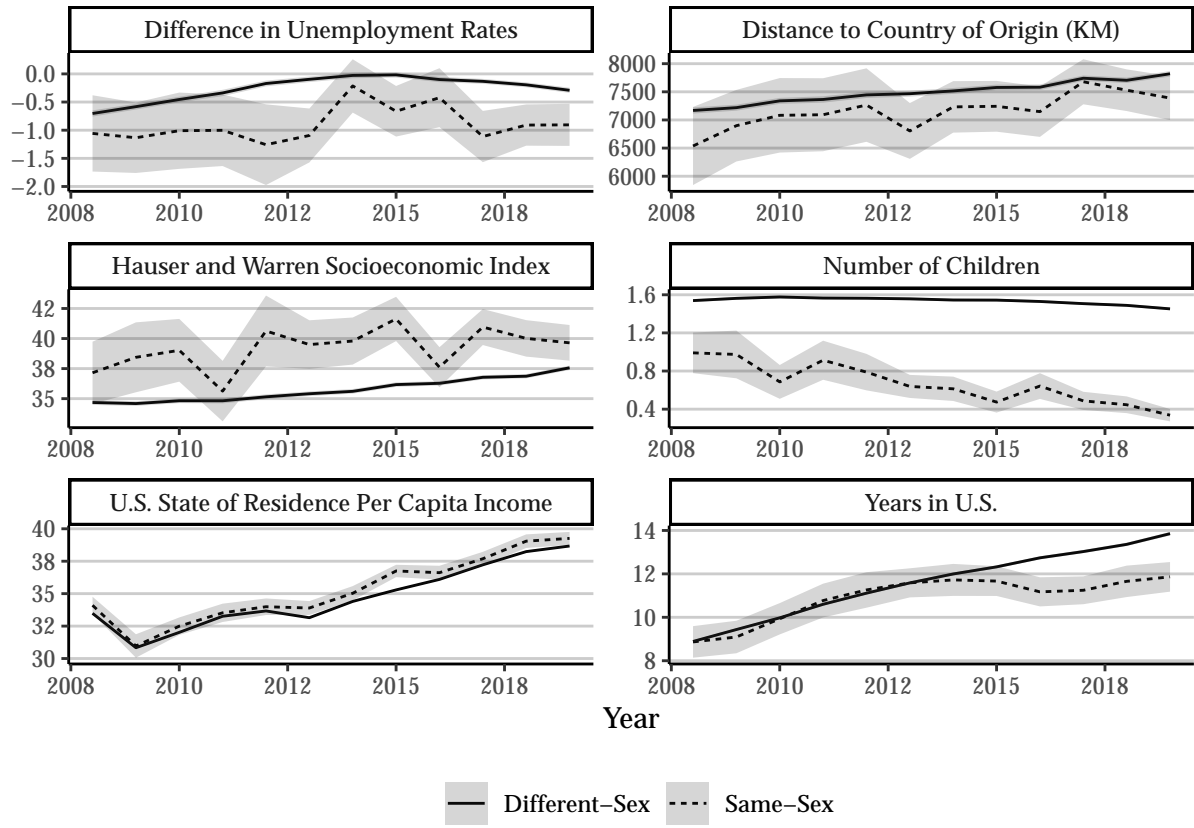

Figure B.3: Additional descriptive statistics for immigrants in couples 2008-2019, with survey weights and 95% confidence intervals. All currency in 1000s of 1999 dollars.

C Robustness Checks

C.1 Adjusting proportions based on empirical mismatch rates

Published papers using the ACS to study same-sex couples overwhelmingly use the method by [Gates & Steinberger \(2009\)](#) employed our main paper to adjust for misreporting. However here we implement a novel method to adjust proportions of estimated immigrants in same-sex couples, based on the estimated mismatch rates from two U.S. Census Bureau studies. Beginning in 2019, the ACS provides explicit categories for “Opposite-sex husband/wife/spouse,” “Opposite-sex unmarried partner,” “Same-sex husband/wife/spouse,” and “Same-sex unmarried partner” ([Walker & Taylor, 2021](#)), so sex misreporting in the 2019 data is unlikely. Hence in most sensitivity analyses below, 2019 estimates are not adjusted for misreporting.

In a Census Bureau working paper, [Kreider & Lofquist \(2015\)](#) use personal information such as names and addresses match same-sex couples from the 2010 ACS to Social Security administrative data. They find that 57 percent of married couples coded as same-sex in the ACS are coded as

different-sex in the administrative data. The corresponding sex mismatch rate for unmarried same-sex couples is 7 percent. (Our data include 4,632 married and 4,428 unmarried same-sex immigrant couples.) A follow-up study (Kreider et al., 2017) shows that these mismatch rates appear to have fallen: In a 2016 ACS test module that included explicit categories for different- and same-sex spouses and partners, 31 percent of married and 3 percent of unmarried same-sex couples had inconsistent sex responses. This decreasing mismatch rate may be due to the greater numbers of same-sex couples openly identifying themselves as well as the growing popularity of responding to the ACS via Internet (see Supplementary Material), a response mode introduced in 2013 which is now the default (U.S. Census Bureau, 2017). In the 2016 test of the ACS, the mismatch rate for mail-in responses was 47 and 6 percent for married and unmarried same-sex couples, respectively, whereas for Internet responses they were only 22 and 2.4 percent (Kreider et al., 2017). A computer-assisted telephone interviewing (CATI) or computer-assisted personal interviewing (CAPI) response mode is sometimes administered as well, but the 2016 study did not assess its error rate. In the 2010 ACS, Kreider & Lofquist (2015) find CATI/CAPI sex reporting mismatch for 46 and 13 percent for married and unmarried same-sex couples, respectively. In our sample of immigrants in same-sex couples, 2,257 responded by mail, 1,202 responded by CAPI/CATI, and 3,618 responded by Internet survey. Response mode proportions by couple type are shown in Table C.1.

Table C.2 shows the mismatch rates estimated by Kreider & Lofquist (2015) and Kreider & Lofquist (2015). In the supplemental analysis below (Table C.3), we use these apparent mismatch rates to adjust proportions used in models in Table 3 of the main paper. Each proportion is adjusted separately by marital status and response mode. For example, all internet respondents coded as being in married same-sex couples have their final proportion reduced by 22.5%. For mail-in responses, the proportions are reduced by the average between the two studies (53 percent for married and 6.3 percent for unmarried couples).

Table C.1: Response mode proportions for different- and same-sex couples, by year. Proportions are within couple type and year.

respmode	same_sex	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
